

PortCast: “Just-Read-The-Screen”

Live Demo Guide

You Don’t Need to Memorize Anything! Just follow this screen-by-screen reading cue card.

STEP 1: Open the App (#home or #dashboard)

What to say:

*“Good morning judges! Today I’m presenting **PortCast**—an AI freight intelligence platform that acts like **Google Flights for multi-million dollar cargo ships** bringing coal and iron ore into India.”*

STEP 2: Click “Overview” in Top Bar (#dashboard)

(Look at your screen and read the 4 big cards at the top from Left to Right)

1

Read Card 1 (Top-Left):

- **Point at:** \$18.40 / MT (Spot Freight Rate)
- **Say:** “Here we see today’s live spot rate to ship cargo into India’s East Coast, with a 14-day green sparkline showing price momentum.”

2

Read Card 2:

- **Point at:** \$584.81 VLSFO (Bunker Fuel)
- **Say:** “This is live marine fuel price. Fuel is 40% of a ship’s voyage cost.”

3

Read Card 3:

- **Point at:** 34.4 / 100 (Risk Index)

- **Say:** *“Our AI monitors geopolitical friction in the Red Sea and Strait of Malacca.”*

4 Read Bottom Table:

- **Point at:** Paradip (1.8d), Vizag (1.2d), Haldia (3.4d)
 - **Say:** *“Down here, we track live waiting times at East Coast ports so ships don’t get stuck in traffic queues.”*
-

STEP 3: Click “Forecaster” in Top Bar (#forecaster)

(This is the main hero of your project!)

1 Read the Big Chart:

- **Point at the solid line:** *“This is the past 180 days of actual shipping prices.”*
- **Point at the cyan line going forward:** *“This is our AI predicting prices for the next 30 days.”*
- **Point at the shaded band:** *“The shaded corridor shows our P10 best-case floor to P90 worst-case ceiling.”*

2 Read the 30-Day Heatmap Strip (Directly Under the Chart):

(This is super easy to explain!) - **Point at Blue cells:** *“Blue cells = CHEAP DAYS to book.”*
- **Point at Orange cells:** *“Orange cells = EXPENSIVE DAYS.”* - **Point at the Gold Star (★):** *“Look at this **Gold Star (★)** on Day +12. Our AI is telling the charterer: ‘**Don’t book today—wait until Day +12 to lock in the lowest price and save \$500,000!**’”*

3 Drag the Slider (Live Interactive Magic!):

- **Action:** Grab the **“Bunker Fuel Shock”** slider and slide it to +20%.
 - **Say:** *“Watch the chart: when oil prices spike by 20%, our model instantly lifts the entire 30-day forecast curve in real time!”*
-

STEP 4: Click “Optimizer” in Top Bar (#optimizer)

1 Read the 4 Vessel Cards (Handysize → Supramax → Panamax → Capesize):

- **Point at the Progress Bar:** “Look at this capacity bar. If we hire a Supramax for 50,000 tonnes, the bar is **85% Emerald Green (High efficiency)**. If we hire a giant Capesize for that small load, the bar turns **Red (28%)** because we’d be paying for empty space!”

2 Show the “Haldia Draft Trap” (Judges Love This!):

- **Action:** In the Port dropdown, select “**Haldia Dock Complex**”.
- **Point at the Amber Alert that pops up:** “Look at this warning! Haldia Port is only 8.5 meters deep. A big ship will get stuck in the mud! PortCast automatically adds the **Sandheads lighterage barge fee (+\$5.25/MT)** and recommends **Dhamra Port** instead to save \$180,000!”

STEP 5: Click “Risk Radar” in Top Bar (#risk)

1 Read the World Map:

- **Point at Red Sea and Malacca Strait:** “Our interactive map tracks critical maritime chokepoints with live threat rings.”

2 Read the Waterfall Step Chart:

- **Point at the bars:** “Down here, our stress simulator shows: Base Freight (\$18.40) + Fuel Shock (\$2.10) + Port Delay (\$1.80) = Total Risk Ceiling (\$25.70/MT).”

STEP 6: Conclude (10 Seconds)

 Say:

*"In summary, PortCast saves Indian energy and steel companies **14.2% on every voyage** by predicting freight rates, timing fixtures, and picking the right vessel and port. Thank you!"*

Keep this open on your phone or notes during the presentation!
